Abstract

Cloud Computing affects people, process and technology of the enterprise. In spite of having benefits with Cloud computing paradigm such as efficiency, flexibility, easy set up and overall reduction in IT cost, cloud computing paradigm could raise privacy and confidentiality risks. "Not all types of cloud computing raise the same privacy and confidentiality risks. Some believe that much of the computing activity occurring today entirely on computers owned and controlled locally by users will shift to the cloud in the future". In Cloud computing, users connect to the Cloud, which appears as a single entity as opposed to the traditional way of connecting to multiple servers located on company premises. Public Private Partnership these days is a usually adopted pattern of governance to meet the diverse needs of their citizens with confidence and providing quality of these services. Cloud Computing Technology can also act as a facilitator between public and private partnership. In such cases there is a possibility that an external party can be involved in providing Cloud Services having partial control over the data storage, processing and transmission of data and privacy regulations become relevant. Cloud computing has significant implications for the privacy of personal information as well as for the confidentiality of business and governmental information. Thus this paper explores to elicit possible issues and regulations in the area of privacy that affect the implementation of Cloud Computing Technologies.

Key words: Cloud Computing, Personal Information, Privacy Regulations, Privacy Issues, Security Issue, technology

Introduction

The mission critical and enabling activities can be derived from Michael Porter's value chain concept. Mission critical activities are those that directly produce the output of the organisation. Enabling activities are those that directly support the mission [1]. Public Private Partnership (PPP) can be used by the government in order to provide the use of technology to enable such service activities to the public effectively. The purpose of PPP organisations is to communicate, educate, inform, collaborate and manage the public IT management profession. In this kind of scenario, Privacy becomes an important element of discussion because Privacy is considered to be one of the fundamental human rights. Privacy is a fundamental human right recognized in the Article 12 of the United Nations Declaration of Human Rights (UDHR

1948), Article 17 of the International Covenant on Civil and Political Rights (ICCPR 1976) and in many other international and regional treaties. In many of the countries where privacy is not explicitly recognized in the constitution such as the United States, Ireland and India, the courts have found that right in other provisions. The most comprehensive translation of these rights into privacy protection legislation is the recent EU legislation on Data Protection (Council Directive 95/46/EC). Indian IT Act and Rules are having many of those provisions present in the IT policy. According to Dr. Gulshan Rai, CERT, India, no country has implemented a true government cloud so far due to complex legal issues. It is because the three aspects such as privacy, security and right to information are like three vertices of a triangle. If someone wants privacy, one should compromise on security and compromise on the right to information and vice versa. So it is required to strike a balance and for that a lot of maturity and awareness is required. Currently it remains as a challenge to governance. De Boni, Prigmore (2001) argue that the concept of privacy provides a solid basis for the assertion that private information is a form of property, a commodity to be bought and sold like any other commodity as an indication of a clear allocation of economic right. Thus the key battle ground lies with the competing aims of individual privacy vs. national interest.

Cloud services refer to the provisioning of hardware and software resources across the Internet. Cloud Service Providers (CSP) typically offer both refined software services, such as databases and raw compute resources such as storage or processing power. Customers often use these services by treating it as pay-per-use (PPU) model thus it can satisfy the argument of De Boni and Prigmore 2001 to achieve privacy as an economic right. Because by using cloud services, companies can chose to, in effect rent computer resources rather than to invest in them outright having such elasticity of computing resources. Examples of such CSPs include Microsoft, Google and Amazon Web Services (AWS), where AWS is claimed currently the largest.

Cloud Computing Defined and Others Terms

NIST Special Publication 800-145 Draft defined Cloud Computing as a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g. networks, servers, storage, applications and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction.Cloud Computing Models can be categorized as Service Models and Deployment Models. Based on the service functional capabilities Cloud Service Models are classified as Cloud Software-as-a-Service (SaaS), Cloud Platform-as-a-Service and Cloud Infrastructure-as-a-Service (IaaS).

Figure 1. The Cloud Service Layers

Based on the service operational capabilities, Cloud Deployment Models are classified asshown in figure 1.

	Managed by	Owner of infrastructure:	Dedicated hardware No Yes Yes	
Public	Cloud Service Provider	Cloud Service Provider		
Private, external	Cloud Service Provider	Cloud Service Provider		
Private, internal	Internal Organization	Internal Organization		
Hybrid Mixed		Mixed	Depends on contract with the CSP	

Figure 2. Cloud Type Classification

Some definitions of terms that will help to clarify the discussion made in this paper are given here:

Cloud Computer User: A customer or potential customer of cloud computing service. The user may be an individual, business, government agency or any other entity.

Cloud Service Provider: The organisation that offers the cloud computing service. A cloud provider may be an individual, a corporation or other business, a non-profit organisation, a government agency or any other entity.

Third Party: A cloud service provider is one type of third party, which maintains information about or on behalf of another entity.

Privacy: It means free from others interference. Privacy control allows the person to maintain varying degree of intimacy. It helps in protecting the love, friendship and trust.

3 Principles are to be taken into account. They are:

(1) Limiting surveillance of citizens and use of information about them by agents of government

(2) Restricting access to sensitive, personal or private information

(3) Curtailing intrusions into places deemed private or personal.

In 2008, the term cloud computing entered main stream discussion about data protection and privacy. Analysts estimated that during 2009-2014, the global market for cloud computing can grow to \$95 billion and that 12% of the worldwide software market will move to the cloud during that period. So in order to realize the cloud potential, the businesses must address the privacy questions raised by this new computing model.

Privacy Issues in the Context of Third Party Storage

Information stored with a third party (including a cloud computing provider) may have fewer or weaker privacy protections than information in the possession of the creator of the information. IT managers are likely to be wary of surrendering control of their resources to outside providers who can change the underlying technology without customers consent. Thus the issues related to performance and latency can be seen as problematic. Government agencies

and private litigants may be able to obtain information from a third party more easily than from the creator of the information. The expanded ability of the government and other to obtain information from a third party affects both businesses and individuals. For many users, the loss of notice of a government demand for data is a significant reduction rights. In United States of America, the Electronic Communications Privacy Act of 1986 (ECPA) provides some kind of protections against government access to electronic mail and other computer records held by parties (e.g., Internet Service Providers) in an electronic environment. But at the same time, USA Patriot Act, originally enacted in 2001 and amended in 2005 includes provisions allowing the FBI access to any business record by extend the ECPA by compelling the cloud providers to disclosure of records. Similarly Right of Information Law or Freedom of Information Act 2000 kind of laws allow a private litigant or other party might seek records from a cloud provider rather than directly from a user because the cloud provider would not have the same motivation as the user to resist a subpoena or other demand. So Disclosure to third parties by a cloud provider could create problems with other laws, principles and interests.

Similarly the privacy becomes an issue when seeking health information against health related information act, fair credit report act, video piracy protection act, bankruptcy, trade secrets from cloud service providers thus making the effort to maintain secrecy towards debatable.

Web sites keep publishing a long list of publication on their terms and service may be considered as the most important feature of cloud computing for an average user who is not subjected to a legal or professional obligation from a privacy and confidentiality perspective. It is common for a cloud provider to offer its facilities to users without individual contracts and subject to the provider's published terms and service. If these terms of service give the cloud provider rights over a user's information, then a user is likely bound by those terms. This could affect the legality of information sharing by a user. In case of the data stored in multiple locations (in multiple servers) the user might get the reduced risk of legality or increase the risk of failure of protection in terms of not claiming from a specific jurisdiction. If the cloud service provider is an agent of competitor, there is possibility that all the important private information could pass easily to competitor through corrupted prosecutors and intelligence agencies without further notice or process.

Common Principles in Privacy Regulations

The privacy regulations discussed in this paper have much in common with the notable exception of the USA-Patriot Act or it might have been also included with some other name. But it is important to understand that these principles are recognized worldwide as setting the standards privacy. These principles therefore provide a standard in comparing privacy regulations (see figure 3).

Thus Cloud Service provider (CSP) oragnisations have a legal obligation to comply with legislation; these organisations are responsible and accountable for compliance. Organisations can be held liable if a subcontractor breaches compliance with legislation. It is unknown if a CSP is legally considered the same as subcontractor. Currently there is no jurisprudence on this matter. However a CSP can be legally seen as a subcontractor. This implies that organisations should ensure that a CSP is compliant with relevant privacy legislation. Jurisdiction is deemed to impact privacy on Cloud Commuting in other cases.

Vertical axis: Common Principles in the various privacy laws and regulations Check mark: It means the principle is present in the regulation

Thus it can be summarized that various issues in cloud computing includes: Identity management, physical and personnel security, application security, cloud availability and accessibility to customers, privacy and legal issues.

Some Technical Aspects of Cloud Security Issues

There could be a launch of attacks from within the Cloud against external targets such as Cloud-based botnets or botclouds. Two botcloud attacks are Distributed Denial of Service (DDoS) attack and Click Fraud attack. Both of these attacks were constructed and executed in less than one day and for approximately 100 Euros and both were successful in their respective goal. Furthermore, neither attack was detected or shutdown by the Cloud Service Providers. Criminals willing to launch botnet attacks are most likely to commit identity theft. When creating an account for Cloud services, a false name and stolen credit card information is used thus making the cost of the service a non-issue. With a dozen stolen credit cards, a criminal could launch a series of a dozen botclouds, possibly on different CSPs. When one Cloud is finally detected and shut down, the next is launched and so on, resulting in an ongoing, massive attack. CSPs do not currently have a strong incentive to monitor all customers from the time they start using Cloud Services. Current policy is to wait until victims of attacks contact the responsible CSP at which point actions taken to disable the attack. So it is required that CSPs must implement a comprehensive botcloud detection and removal policy and mechanism otherwise botmaster will continue to move their malicious activities into the Cloud and botclouds will continue to grow. This requires the CSPs to proactively monitor for botclouds and deploy cloud related extrusion detection systems.

Conclusion

Cloud computing has the potential to offer the ability to dynamically reconfigure computing resources as demand for computing resources increases or decreases. A Client Service Provider (CSP) needs to be capable of provisioning this demand. In cases where a CSP fails to provide this demand, the CSP itself may be forced to outsource organisational data to a different CSP, amplifying the location related privacy issues portrayed above. Thus the impact of privacy regulations is most dramatic between external Cloud computing and traditional IT. Thus the concept of Cloud Computing can bring many uncertainties with respect to compliance with

privacy regulations. So current privacy regulations are clearly not enough to solve all the privacy issues related to Cloud computing. More matured awareness is required about both the issues and about the existing regulations and seems become a good first step to remedy this. Security could be seen as a major issue in the adaptation of Cloud computing as compared to compliance to privacy regulations. Not many organisations are completely aware of privacy issues in Cloud Computing.
